Vacuum

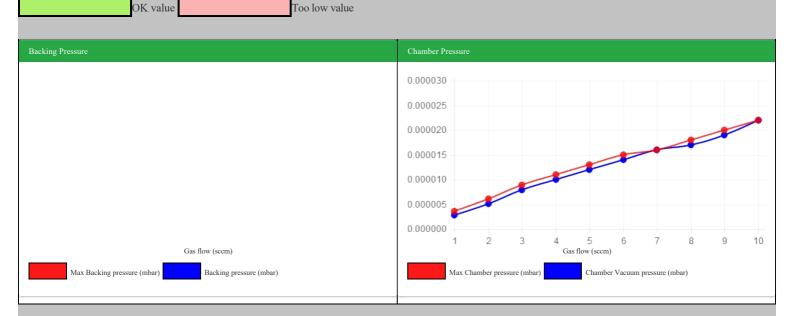

Test of vacuum tightness on PSS

Plot vacuum pressure as function of gas flow from 1sccm to 10 sccm.

Vacuum pressure vs gas pressure should be a linear relationship.

Gas flow setting: 5,0 +/- 1 sccm

Gas flow	Chamber vacuum pressure (mbar)	Backing pressure	Max Chamber pressure (mbar)	Max Backing pressure (mbar)
1	2.8E-6	0.012	3,60E-06	1,30E-02
2	5.1E-6	0	6,10E-06	2,10E-02
3	7.9E-6	0	8,90E-06	2,70E-02
4	1.0E-5	0	1,10E-05	3,30E-02
5	1.2E-5	0	1,30E-05	3,90E-02
6	1.4E-5	0	1,50E-05	4,50E-02
7	1.6E-5	0	1,60E-05	4,70E-02
8	1.7E-5	0	1,80E-05	5,40E-02
9	1.9E-5	0	2,00E-05	5,90E-02
10	2.2E-5	0	2,20E-05	6,50E-02

Pass critera: Linear relationship between vacuum pressure and gas flow. (Blue line should be below red line)

Vacuum leak test performed on PSS
With the vacuum system operating in pump mode with all BEV closed and without gas flow.

Set Vacuum system on VCU to Standby and observe the leak rate into the cavity (using pressure as proxy)

Time from Set Standby (sec)	Vacuum pressure (mbar)	Max leak rate
0	1.0E-7	1,80E-07
10	8.3E-7	1,00E-06
20	1.2E-6	1,50E-06
30	1.5E-6	1,90E-06
40	1.8E-6	2,30E-06
50	2.1E-6	2,70E-06
60	2.5E-6	3,00E-06
70	2.8E-6	3,30E-06
80	3.1E-6	3,60E-06
90	3.3E-6	3,90E-06
100	3.5E-6	4,20E-06
110	3.8E-6	4,60E-06
120	4.0E-6	4,90E-06

Pass critera: Time to reach 1.0E-5 mbar> 10 s (Blue line should be below red line)

Vacuum	• Switch on the water cooling to the diffusion pump	
	Press STANDBY on the VCU, record time	
	Standby time	
	Actual standby start time: 10:27	
	• Verify that the green DP-lamp on the VCU lights up within 30min, re-adjust DP temp-switch as required	
	DP-lamp activation time	
	DP -lamp activated in (min): 0 Max 30min	
	• Press PUMP on the VCU and note the following values:	
	Pumping down	
	Time before HVV opening 11 10-15 min	
	Actual time for HVV opening: 0 <30s	
	Actual time to reach 1.0*E-5 0	
	• After reaching the vacuum value of 1.0*E-5 open the IS gas flow at 10sccm for 15 minutes	

Vacuum	WARNING! Diffusion pump may be very warm, verify that at least 2hrs has passed since pump shutdown. WARNING! Rotary and/or diffusion pump oil may be radioactive, verify activity level by performing an activ NOTE! Verify that all cables are free from interference with the diffusion pump, interference may cause cab shortcut • Verify the oil level and the color of the rotary pump oil, re-fill or change as required, record re-filled or changed volum	ole melting and/or electrical
	Rotary pump oil level	
	Date of the last replacement of oil: 2022-11-07	
	Volume filled/changed (ml): 0	
	Maintenance of the diffusion pump: to be performed every 5 years	
	Last maintenance of the diffusion pump	
	Ventilate the diffusion pump by removing Pirani 1	
	NOTE! Verify that the water cooling is shut off before disconnection of the diffusion pump	

Remove the diffusion pump and drain the oil

NOTE! Measure the lenght of the Jet assy before it is disassembled. The lenght is critical to pump performance.

- Disassemble and clean the diffusion pump
- Replace the heater
- Reassemble, reinstall and fill the diffusion pump with new oil

Diffusion pump oil replacement

Volume filled/changed (ml): 0

- Verify the condition of the rotary pump oil mist filter, clean, inspect or replace as required
- · Verify the condition of the rotary pump oil mist filter O-ring, clean, inspect for damage and/or deformation, replace as required
- · Verify the functionality of the pirani gauges and the penning gauge, clean, inspect or replace as required

Targets

- Disconnect all targets from the service PC
- · Switch off the manual water valves to the targets on the water manifold (the large wall mounted water manifold)

NOTE! 18F2 Deuteron target system requires NEON gas flushing before opening of connections.

NOTE! 18F2 Proton target system requires ARGON gas flushing X 3 before opening of connections.

NOTE! Do not disconnect the C11CH4 target, any atmosphere entering this target may ruin the target.

- Physically disconnect all targets from the cyclotron and transport them to safe/shielded location
- Verify condition and functionallity of the beam exit valves (BEV), repair or replace as required

BEV & Compressed air Tubing: annual replacement for BEV/ 3 years replacement for air tubing

Beam

Beam

- Perform a paper burn test in DB for both targets
- Dismount the paper burn targets and put the standard targets in place
- Check the He flow inside flowmeters fot both target in SB and DB and close the bunker
- · At the Service System: Connect targets and verify target vacuum tightness, repair and/or replace as required
- At the Service System: Select FILL TARGET (for F18 target select: O16 water) and verify the fill volume verify that the target pressure increases in accordance with the specification for the specific target type, adjust, repair and/or replace as required
- Verify that the vault door are closed
- Connect the Service System to the ACU and power up the Service System, set the master to local and log in to the Service System

NOTE! Only Service System: BEAM CONTROL and TARGET pages are to be utilized.

- Start the water cooling, verify vacuum system status at the VCU, set magnet to on and set configuration value
- Set RF to STANDBY, select target and set the extraction foil to the selected target position, park the other extraction foil
- Set the flip-in probe to: IN, select H- particle, set RF to NORMAL
- Verify Ion-source gas, turn on the Ion-source and set to 50mA, verify current on the flip-in probe and set flip in probe to OUT

NOTE! Maximum collimator and tuning (extraction foil current) current is 10µA.

- Read and record the target, the foil, the collimator current, adjust the extraction foil until equal collimator current is achieved
- Adjust the magnet current, the RF DEE voltage, the RF delta DEE voltage, the extraction foil current and the gas flow to achieve optimal beam

MAINTENANCE TRACKING TOOL

RFPG

RFPG WARNING! High voltage (up to +7800V DC).

- Switch off the power to the RFPG
- Open the TAU and verify that the grounding device is operational (completely in contact with the RF tube). Verify that no burn marks, loose cables or leaking water are present, clean, repair and/or replace as required, close the TAU
- Open the GSPU and verify that no burn marks or loose cables are present, clean, repair and/or replace as required, close the GSPU
- Open the DPA and verify that no burn marks, loose cables or leaking water are present, clean, repair and/or replace as required, close the DPA
- Replace the RFPG air inlet filters, clean the front grid cover, inspect the grid of the back of the cabinet, clean if required

WARNING! High voltage (up to +7800V DC). It is important to discharge components before removal of rectifier diode/s.

- Open the TPSU, verify TPSU diode status (48 diodes), diode bridge should read 0,8-0,9V forward voltage drop from negative (-) pin to positive (+) pin. A defective diode bridge will read close to/or 0V, repair and/or replace as required
- $\bullet \ Verify \ tightness \ of the \ TPSU \ terminal \ screws \ TBL \ 1, \ TBL \ 2, \ TBL \ 3, \ tighten \ and/or \ replace \ as \ required, \ close \ the \ TPSU$
- \bullet Verify water cooling pressure, repair and/or replace as required, read and record

RFPG water cooling pressure

Pressure reading (bar): 2.50

- Switch on the RFPG and verify the functionality of the RFPG fans, repair and/or replace as required, reinstall all covers
- Open the DPSU, visually verify that no components are loose or appears to be damged, repair and/or replace as required
- Verify the voltage output in the DPSU, adjust, repair and or replace as required, read and record. Re-install the DPSU

DPSU voltage

Parameter	Voltage	Ripple (peek to peek)	Voltage limits/ripple limit
+48V (V1):	47.81	1.34	47.5-48.5 VDC/200mV

• Verify SCU functionality for H-, adjust, repair and/or replace as required, read and record

H-, at the PSS magnet page: switch on the water cooling and the magnet, set the magnet to the H- configured value, read and record the OFF value as displayed on the measurement module/ the PSS

H-, at the PSS RF page: Select STANDBY, after 1 minut RF state should be: STANDBY READY, read and record the STANDBY value as displayed on the measurement module/the PSS

Verify VAC voltage and ripple at the load phase detector board

H-, at the PSS RF page: Select NORMAL, let the RF run for one hour, read and record the H- (_kV) value as displayed on the measurement module/the PSS, in case of any significant change in any value, adjust, repair and/or replace as required

When finished, download the statistics log, the two milliseconds logs and the five seconds log. Save the log files in the backup folder in the service laptop, C:\backup\scu.

If there are any significant change in any value, investigate the reason. Pay special attention to the analog in voltages, humidity and temperature, adjust, repair and/or replace as required

If there are any significant change in any value, investigate the reason. Pay special attention to the analog in voltages, humidity and temperature, adjust, repair and/or replace as required

At the PSS RF page: Select STANDBY, RF shall change state to: STANDBY READY

SCU readings

PSS	RFPG status		
P	Off/ston dhy	H- (35kV)

Ion-Source

Ion-Source

• At the PSS Ion-source page: Verify gas flow regulator functionality by selecting H-, set value and read out is to match and zero setting is to provide zero reading, read and record

Gas handling			
Checkpoint	Set value	Reading	
H2 gas pressure (bar):	4.00	4.00	• Read the

• Read the value on the last stage of the supply line

- Switch on the H- gas and set to your normal value verify that the flip in probe is in and switch on the Ion-source, set to 50mA
- Start the IS conditioning procedure: turn ON Ion source and leave it at a current of 20 mA for 10 minutes
- NOTE! Probe reading of 200µA should be displayed prior to 600mA on the Ion-source
- * Switch on the H- gas, set to 5,0ml/minut, verify that the flip in probe is, switch on the Ion-source, set to 50mA, read and record the Ion-source current/voltage and the probe current, proceed by 50mA increase steps until 200µA on probe are displayed

H- burning properties			
Gas 5,0ml/minut	DEE 1(kV)	DEE 2 (kV)	Magnet (A)
4.0	36.00	1.50	429.80
Ion-source current (mA)	Ion-source	voltage (V)	Flip in probe current (μA)
48.00	127	2.00	43.00
68.00	123	3.00	87.00
98.00	1076.00		154.00
118.00	975.00		204.00
147.00	862.00		268.00
166.00	801.00		310.00
198.00	728.00		363.00
0.00	0.00		0.00
0.00	0.00		0.00
0.00	0.00		0.00

- Repeat operation for D- with gas at 3,5ml/minut. At the PSS: Switch of the Ion-source and set RF to STANDBY
- At water manifold 1: Open the two water valves for the upper and the lower targets as per system configuration

NOTE! Verify that all required gas supplies are adequate, that all target media is available and activated as per system configuration, and that a vial is connected to the end of the delivery line. If gas supplies and/or target media levels are becoming low and/or are empty, inform the customer.
